Maximum brightess. Bipolar expansion (Chesneau et al. 2011).

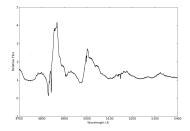

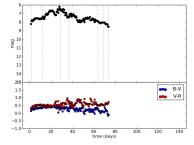

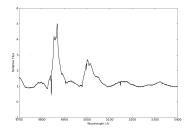

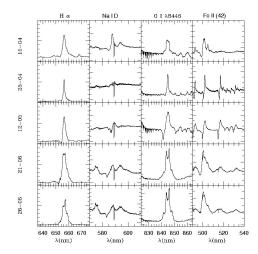

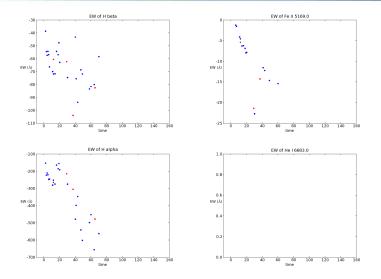

T Pyx 2011: Equivalent Widths

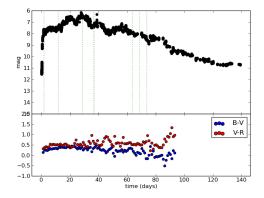

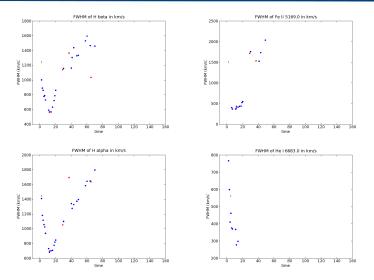

Figure: The AAVSO light curve.

T Pyx 2011: FWHM

T Pyx is a "super-hybrid" nova ( "He/N"  $\Rightarrow$  "Fe II"  $\Rightarrow$  "He/N").

T Pyx is a "super-hybrid" nova ("He/N"  $\Rightarrow$  "Fe II"  $\Rightarrow$  "He/N").

Physics behind the evolution still uncertain. (at least, unclear to me)  $% \left( {{\left[ {{{\rm{m}}} \right]}_{{\rm{m}}}}_{{\rm{m}}}} \right)$ 

T Pyx is a "super-hybrid" nova ( "He/N"  $\Rightarrow$  "Fe II"  $\Rightarrow$  "He/N").

Physics behind the evolution still uncertain. (at least, unclear to me)

The mystery of the "recurrence time" not being a clock on its way to solution (?)  $\ldots$ 

 $\dots$  do we know the whole story on the binary (i.e. mass of the components)?

T Pyx is a "super-hybrid" nova ( "He/N"  $\Rightarrow$  "Fe II"  $\Rightarrow$  "He/N").

Physics behind the evolution still uncertain. (at least, unclear to me)

The mystery of the "recurrence time" not being a clock on its way to solution (?)  $\ldots$ 

 $\dots$  do we know the whole story on the binary (i.e. mass of the components)?

Let's have some more T Pyx with Farung!
