

## DOCUMENT P4:

**The relationship between the number of trawls and long line sets at different spatio-temporal resolutions**

MARAM/IWS/2022/HAKE/P4

**28 NOVEMBER 2022**

# Document P4, Objective

Is there a negative relationship between the number of trawls and the number of sets at operationally meaningful spatial and temporal scales?

# P4: Dataset and data preparation

Combined the deep sea trawl and longline data sets

Focussed on the period 2015 to 2022

# P4: Operationally meaningful time scale

Day

# P4: Operationally meaningful spatial scale

## Cannot be too small or too large

Too small: There must be a negative relationship since you can't trawl on top of a longline set

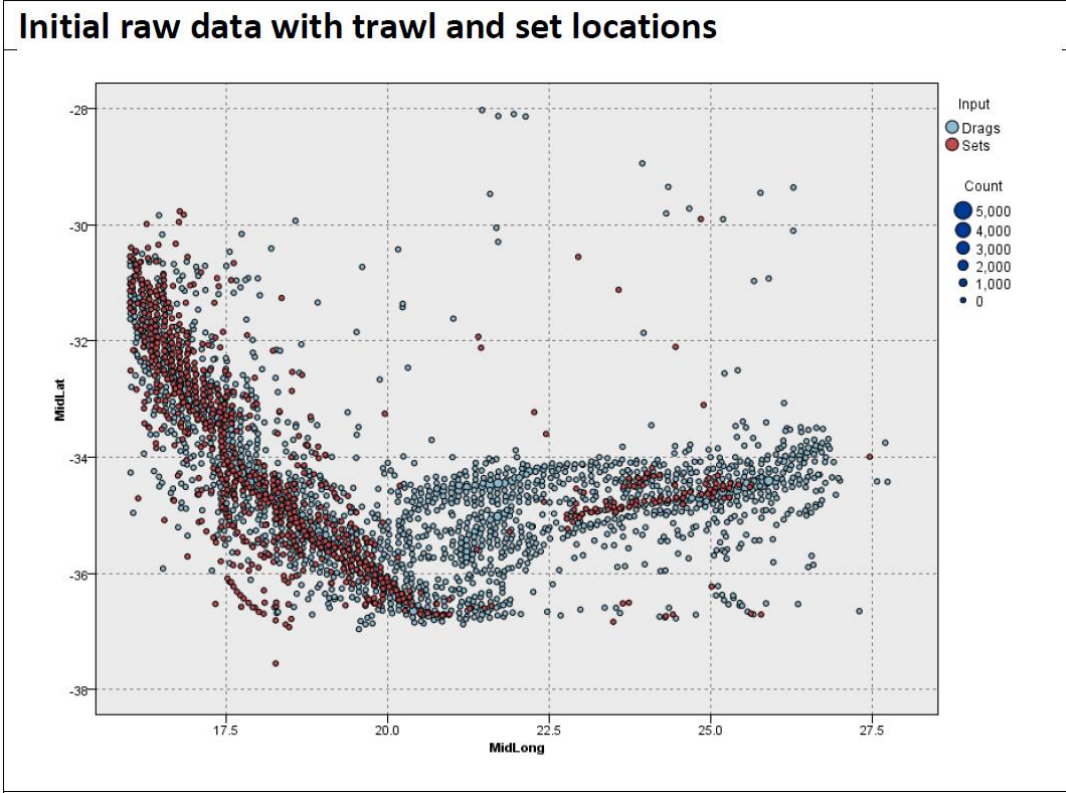

Too large: Will miss important interactions

Operationally meaningful: 10s of kilometres (set length  $\sim$  25 km, trawl path length could be 10 – 20 km)

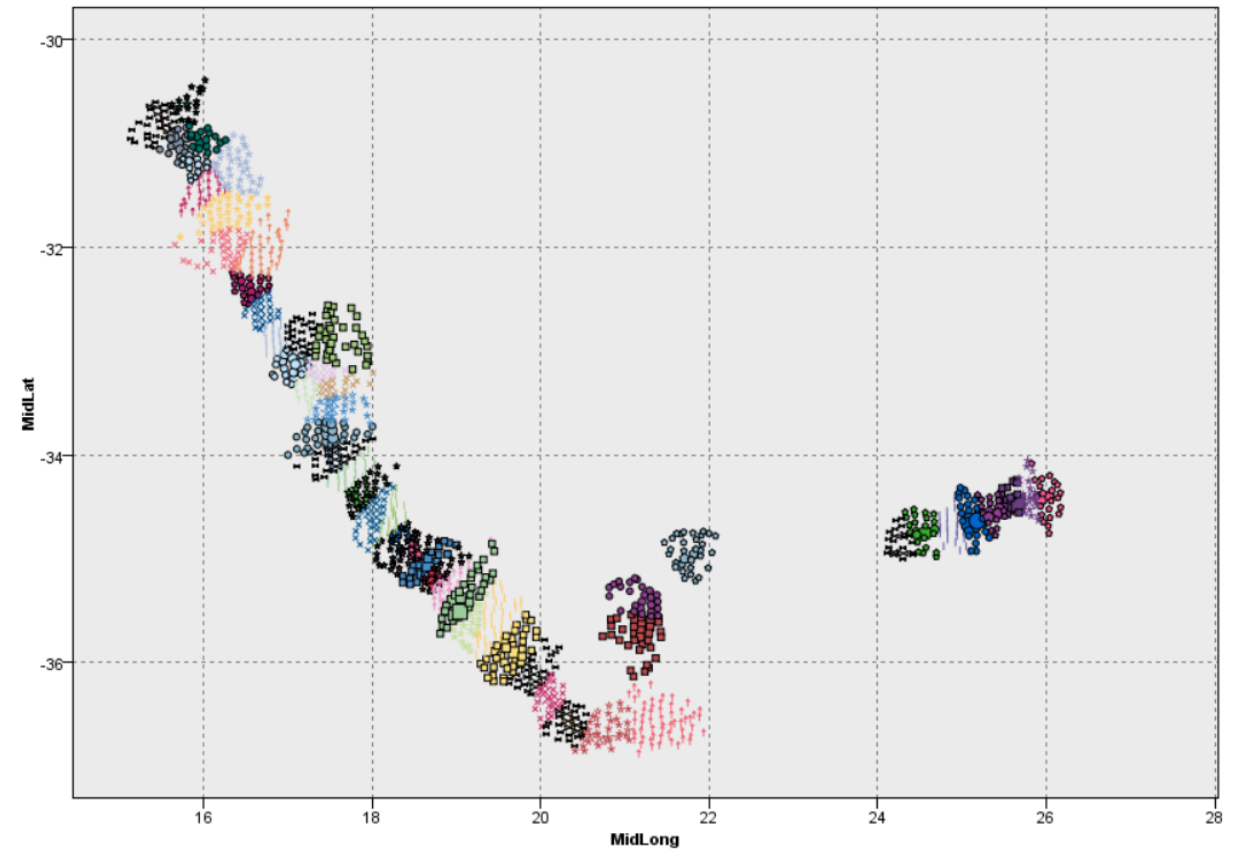

Divide spatial extent of fishing into 10s or 100s of subareas

K-means cluster, simple binning procedures, various dimensions

# P4 – Additional data trim, 95% of catch 2015 - 2022

**200 cluster example, 50 clusters remain**

# P4 – Relationship between number of trawls and number of sets

## 300 Cluster example

Mean number of trawls per Cluster\_Day vs #sets per Cluster\_Day

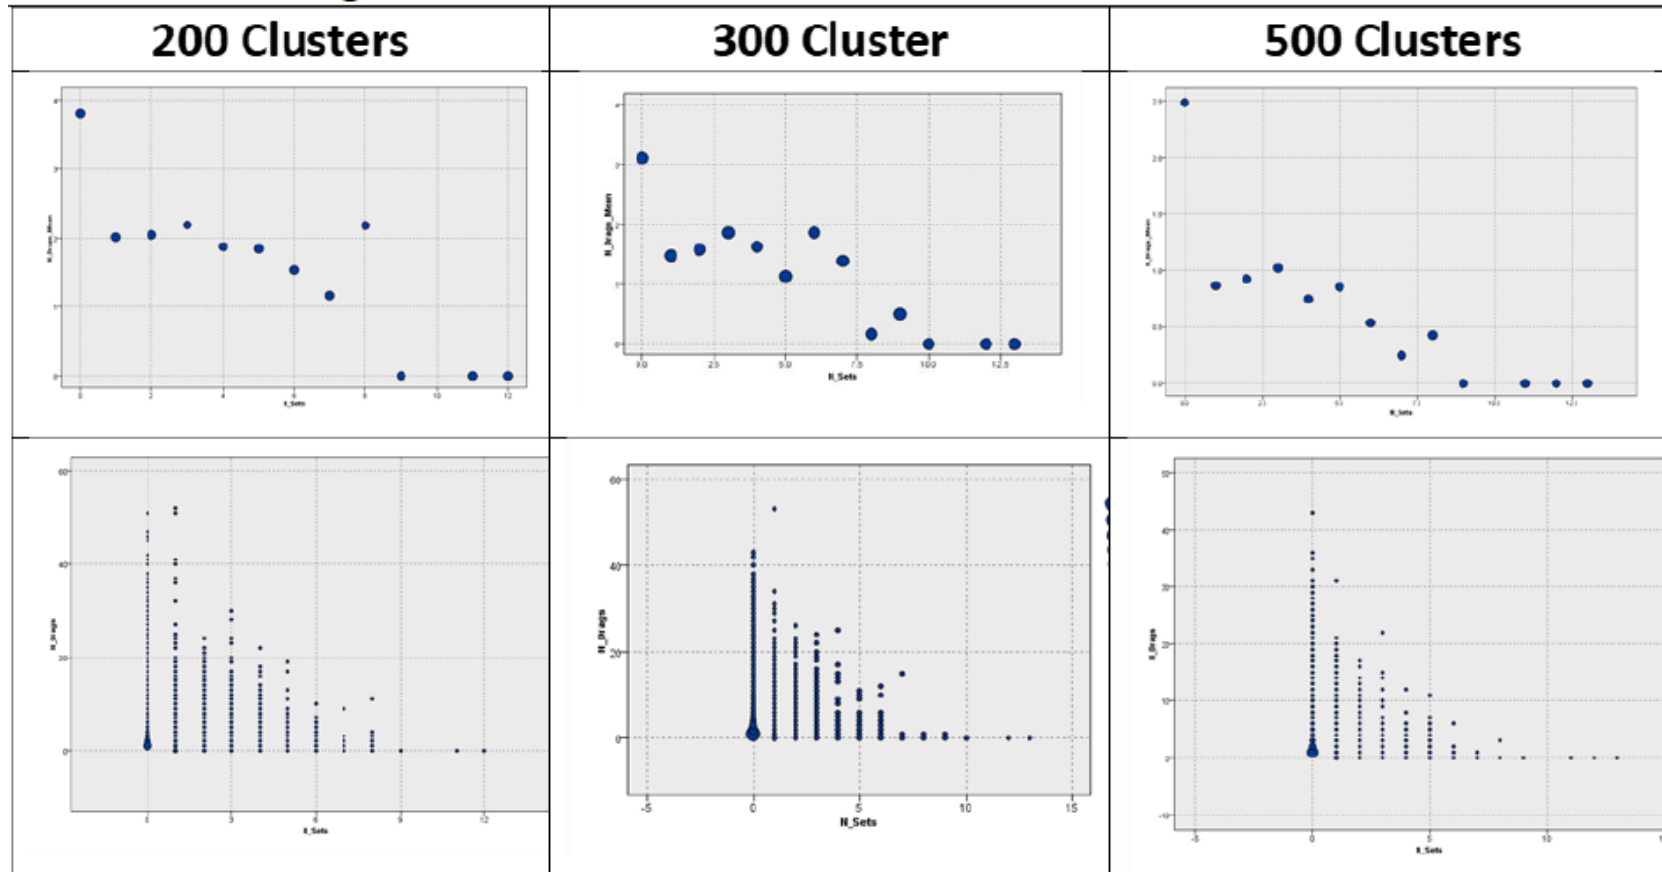

Number of trawls per Cluster\_Day vs #sets per Cluster\_Day

# P4 – Other clustering options

Use of actual longline set data

# P4 – There may just be areas that are naturally suited for trawling and others naturally suited for longlining

Include 'Cluster' as a factor in a GLM relating #trawls to #sets

# P4 – Result could be a numerical artefact

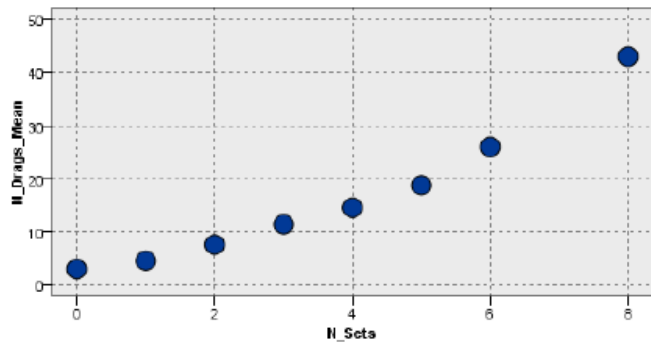

Exclude longline sets from the analysis (~7% by number)

Randomly convert trawls to sets, 7% of the trawls.

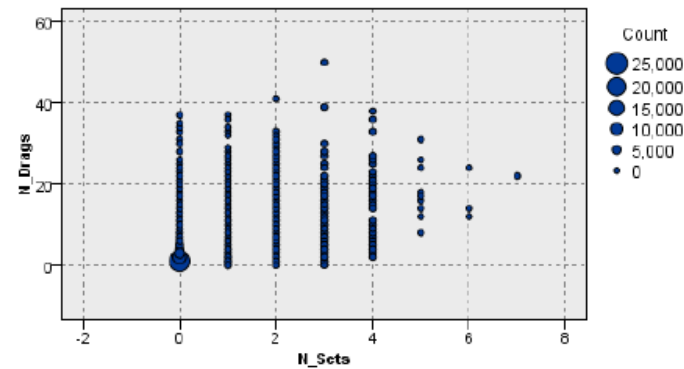

Repeat the analyses – graphical results only.

# P4: 7% of trawl are randomly converted to sets

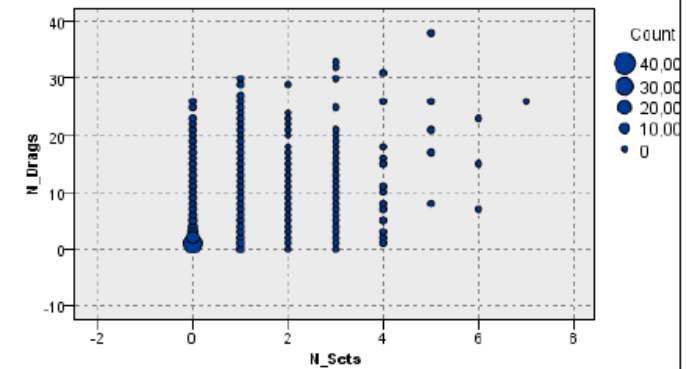

## 200 Clusters

## 300 Cluster

## 500 Clusters

# P4: Conclusions

When the spatio-temporal resolution is attenuated sufficiently, to the spatial scale of, say, 10 to 60 km, and to a temporal scale of a single day, then there is evidence of a negative relationship between the number of trawls and the number of longline sets.

This shows that the presence of one type of fishing operation reduces the incidence of another kind of fishing operations in proximal locations.

This is consistent with a scenario in which in any day there is competition for access to some clusters, resulting in a negative relationship between the number of trawls and the number of sets.
