

Addendum to Fisheries/2010/MAY/SWG-SCRL/08

New Model 3 assessment results and CC projections

An updated version of Model 3 is presented here which has the following modifications from the version reported in the main text of Fisheries/2010/May/SWG-SCRL/08:

- 1) Somatic growth parameters estimated during fitting procedure to be used for all length-at-weight relationships.
- 2) Mean of recruit residuals over 1974-2000 period forced to zero
- 3) CPUE series variability (the σ parameter) be constrained to be at least 0.1 in the likelihood maximization process, because of potential problems of over-fitting given models with large numbers of estimable parameters

Note that in this case a constant catch of 345 tons more than meets the existing target of a 20% increase in the 2006 spawning biomass by 2025.

Table Add.1: Updated 2010 Model 3 estimated parameters and quantities of management interest. Biomass quantities are in MT.
